(Amended) As shown in Figs. 1A and 1B, an embodiment of the route switch packet architecture according to one aspect of the invention comprises Bi-directional Access Port (BAP) 10, Host Packet Injection (HPI) 14, Flexible Data Input Buffer (FDIB) 20, Test 28, Clock & PLLS 30, Analysis Machines (AMs) 42,56,70,84, Packet Task Manager (PTM) 98, Global Access Buses (GAB) 108,110,112,114,116,118, External Memory Engines (EME) 120,156, Internal Memory Engines (IME) 122,152, Packet Manipulator (PM) 126, Hash Engine (HE) 158, Centralized Look-Up Engine Interface (CIF) 160, Flexible Data Output Buffer (FDOB) 162, and Search/Results/Private 166,168. With the exception of Search/Results/Private 166,168, the combination of the above described elements may be considered a multi-thread packet processor.

On page 37, lines 14-18, amend the paragraph beginning "Fig. 4 shows a block diagram that depicts one implementation ..." as follows:

(Amended) There are two asynchronous boundaries. The first is in the GAB controller, which synchronizes between the internal multi-thread packet processor clock (RSP2CLK) and the local clock (MEMCLK) to run the EME core. The second is in the high-speed access port (HSAP) controller for PM 126.

See the attached Appendix for the changes made to effect the specification.
